

1. Write a program where you make a structure `pinfo` where you can store peoples information. You'll need fields for the persons age (integer), first and last names (strings, 10 and 20 characters) and height (real number) Write a function that read the information from the keyboard, and a function that writes the information to screen.
2. Extend the program of the previous assignment by adding commands that write the information to a file, say `pinfo.txt`. Ask from the user for the name, age and height and save it to a struct `pinfo` variable called `info1`. Then then program should save the information to a file and then immediately read the information from the file to a struct variable `info2` and print it to the screen.
